

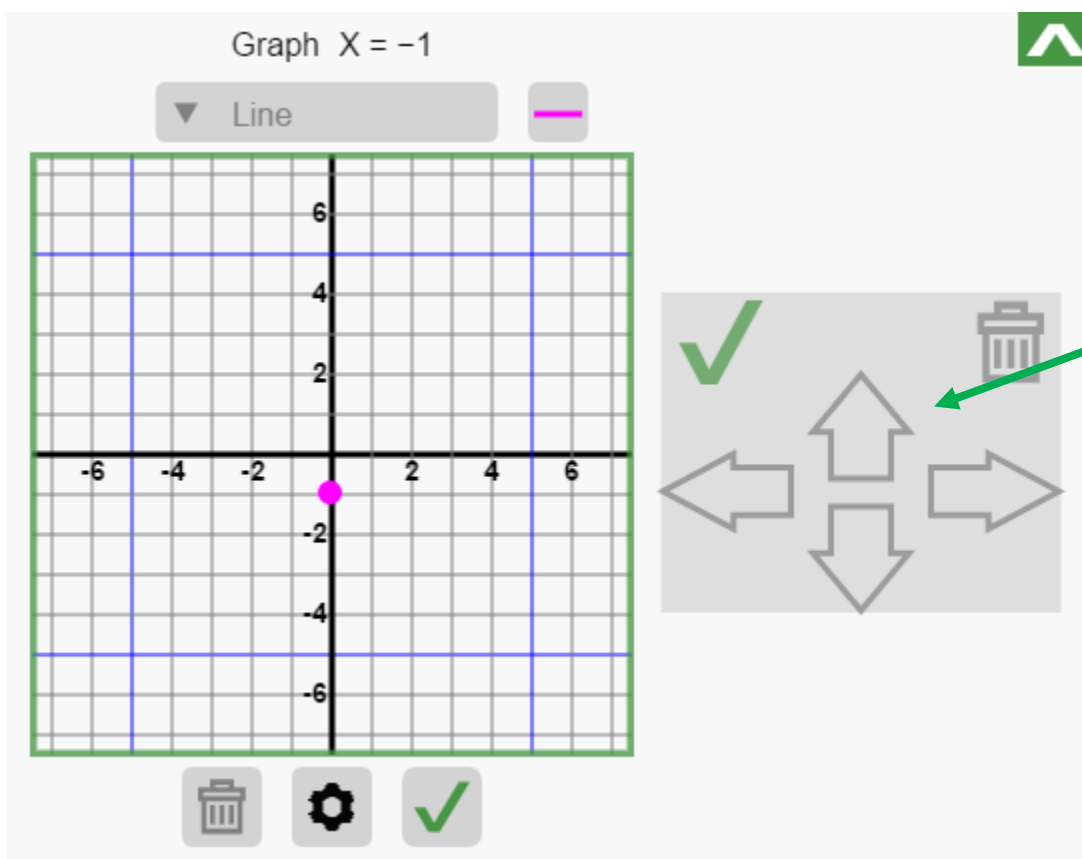

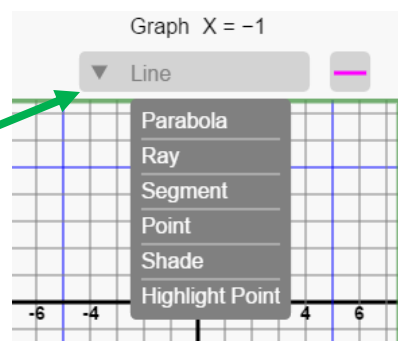

Graphing Basics on Web

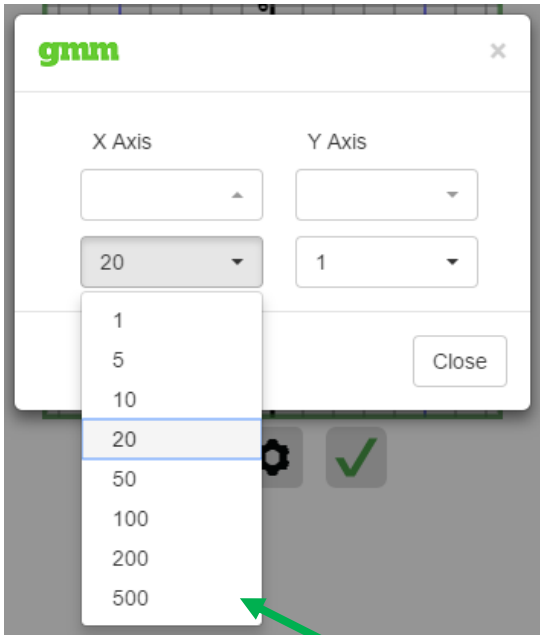

To graph an equation on your mobile device, tap anywhere on the graph for your first point. Use the arrows to move your point closer to its exact position. Tap the graph again where you want the location of a second point on the line. A blue line through the two points you designated will appear. If you don't like it's location, tap the graph a third time and the old line will disappear.

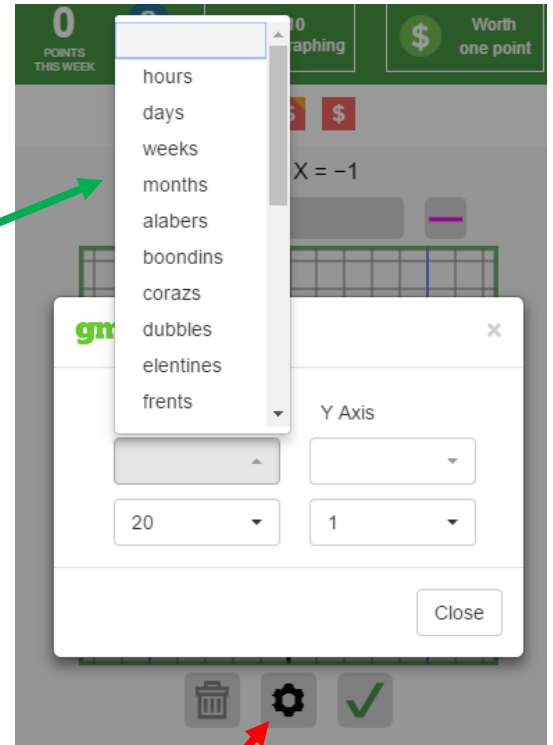

Tapping the drop down menu allows you to graph other figures.

Tapping the  icon opens a new window that allows you to label the X and Y axes of your graph with units and increments.

UNITS

INCREMENTS

Hit **Submit** when done.
